Executive summary

The EU derivatives market: Outstanding notional amounts in the EU derivatives market grew 29% to EUR 314tn in 4Q22 from EUR 244tn in 4Q20. Intragroup notional amounts particularly grew, up 91% from 4Q20, to EUR 44tn. There was little change in the relative shares of asset classes. Interest rate derivatives (IRDs) were 78% of notional amount in 4Q22 (+1pp from 4Q20), currency 14% (+1pp), while equity, credit and commodities were 5%, 2% and 1% respectively. There was a shift away from non-banks to banks (62%, +7ppt), with credit institutions and investment firms continuing to hold the most notional amount, while CCPs account for 7% and non-financials 4%. Largely as the result of continued trading in UK trading venues that are no longer recognised as equivalent, the share of ETD and OTC exchanged on trading venues both fell. ETD fell to 5% by 4Q22 (-3ppt from 4Q20), while on-trading-venue OTC fell to 11% (-5ppt from 4Q20). Nonetheless, the share of outstanding notional amounts for OTC IRDs and credit that were cleared continued to grow, from 71% in 4Q20 to 77% in 4Q22 for IRDs, and from 41% to 45% for credit. The UK remains the locus of much derivative trading in Europe, with 52% of outstanding notional amounts held in EEA-to-UK (3ppt from 4Q20). EEA exposures to other third counties also grew (to 22%, +3ppt).

Interest rate derivatives: The IRD market grew substantially, by 26% in outstanding notional amounts, to EUR 244tn in 4Q22, up EUR 51tn since 4Q20. A third of the growth was in intragroup positions, whose notional amounts grew 121% to EUR 31tn (4Q22) from 14tn (4Q20), mainly in interest rate swaps held with UK and other third-country counterparties subject to the clearing obligation. Shares held by credit institutions (65%, +7ppt from 4Q20) and investment firms grew (23%, +4ppt) while shares for AIFs (1%, -8ppt) and non-financials (2%, -2ppt) fell, with intragroup growth for both credit institutions and investment firms. OTC positions rose significantly, to 97% in 4Q22 from 93% in 4Q20. Both ETD (3%, -4ppt from 4Q20) and OTC executed on an MTF or OTF fell (13%, -4ppt). A sizeable part of this shift was due to UK venues ceasing to be recognised after 2020, affecting the status of trades subsequently executed on these venues. Central clearing of outstanding IRDs continued since 4Q20, from 71% to 77%, while quarterly clearing rates for the IRDs subject to the clearing obligation, IRDs in G4 currencies and IRDs in NOK, SEK and PLN were both near 100%.

Credit derivatives: Credit derivatives grew significantly, to EUR 7tn in notional amounts outstanding, from EUR 5.7tn in 4Q20. Growth was throughout the reporting period and driven by credit default swaps (CDS) which remain by far the dominant instrument. Growth in intragroup positions was dramatic, quadrupling to EUR 1.1tn (4Q22), accounting for about half of the notional growth overall and almost entirely in swaps, i.e. CDS, and mainly in contracts held with UK (up EUR 0.5tn) and other third-country counterparties (up EUR 0.3tn). The OTC share rose sharply to over 99.7% in 4Q22 from 95% in 4Q20, with falls in both ETD (0.3%, -5ppt from 4Q20) and in on-venue OTC (7%, -2ppt). Again, much of this was related to the change in status of UK venues. Central clearing of outstanding credit derivatives grew from 41% in 4Q20 to 50% in 4Q22 and quarterly clearing rates for the CDS on European indices subject to the clearing obligation averaged around 85%, with clearing predominantly at UK CCPs.
**Equity derivatives:** Equity derivative notional amounts increased 36% to EUR 15tn in 4Q22, from EUR 11tn in 4Q20, with growth mostly in equity options. Equity options also drove a significant increase in the share of notional amounts in ETD (58% 4Q22, +8ppt from 4Q20) which, with an increase in central clearing for OTC derivatives to 5% (+3ppt), increased the share held by CCPs (18%, +16ppt) and increased concentration in the market. By the end of 2022, over half of notional amount was also in contracts with third countries, 31% (+9ppt) to the UK and 22% (-2ppt) to other third countries. While among EEA counterparties, most notional amounts were in contracts held between counterparties based in Germany, France, and the Netherlands, with geographical patterns of exposures remaining similar in 2021 and 2022.

**Currency derivatives:** Currency derivative notional amounts grew by 41% to EUR 45tn in 4Q22, from EUR 32tn in 4Q20. Growth occurred throughout most of the reporting period, peaking in 3Q22 and was mainly from forwards, which continue to be the largest instrument by notional amount (72% as of 4Q22). Swaps and options likewise grew. Their growth was accompanied by a shift to credit institutions, 62% in 4Q22 (+10ppt from 4Q20) and investment firms (17%, +1ppt) away from other firm types. The shift was accompanied by increasing concentration throughout the period. There was also a slight shift towards notional in contracts with non-UK third countries (46%, +3ppt) while those with UK counterparties remained unchanged (22%). Patterns within the EEA remained relatively dispersed compared to other assets, and dominated by Germany, France and the Netherlands.

**Commodity derivatives:** Commodity derivative notional amounts grew 65% in the reporting period, to EUR 3.3tn in 4Q22 from about EUR 2tn in 4Q20. Growth was steady, peaking at 3Q22 at EUR 3.6tn, and was across the largest instruments: swaps, futures, and options. This was fuelled by the Russian invasion of Ukraine in February 2022 increasing commodity prices in 2022, particularly natural gas, and correspondingly increasing notional amounts of new contracts. The share of ETD fell over the reporting period (39% in 4Q22, -10ppt from 4Q20), OTC grew correspondingly to 61%. OTC trading activity grew as prices rose in 2022, part of which may be due to higher margin costs at CCPs during periods of higher prices. Central clearing of OTC finished unchanged at 9% by 4Q22 (unchanged from 4Q20). Central clearing was predominantly in the UK (averaging 91% cleared in the UK).

Note: Year values as of 4Q21 and 4Q22 (10 December 2021, 16 December 2022). Derivatives that do not fall into the asset classes above are excluded as these are a very small proportion of total. OTC contracts on-trading venue are those executed on multilateral or organised trading facilities, other OTC derivatives are considered off-trading venue. Top-five measure is the total notional amount of the exposures of the largest five counterparties. All data, unless otherwise noted, display the EEA30 (no UK data). There are some UK to third country exposures listed because under EMIR some UK entities will still need to report, such as UK AIFs that are managed by an EEA AIF manager.

Market monitoring
The EU derivatives market

Summary

Outstanding notional amounts in the EU derivatives market grew 29% to EUR 314tn in 4Q22 from EUR 244tn in 4Q20. Intragroup notional amounts particularly grew, up 91% from 4Q20, to EUR 44tn. There was little change in the relative shares of asset classes. Interest rate derivatives (IRDs) were 78% of notional amount in 4Q22 (+1ppt from 4Q20), currency 14% (+1ppt), while equity, credit and commodities were 5%, 2% and 1% respectively. There was a shift away from non-banks to banks (62%, +7ppt), with credit institutions and investment firms continuing to hold the most notional amount, with a combined share over 80%, while CCPs account for 7% and non-financials 4%. Largely as the result of continued trading in UK venues that are no longer recognised as equivalent, the share of ETD and OTC exchanged on trading venues both fell. ETD fell to 5% by 4Q22 (-3ppt from 4Q20), while on-trading-venue OTC fell to 11% (-5ppt from 4Q20). Nonetheless, the share of outstanding notional amounts for OTC IRDs and credit that were cleared continued to grow, from 71% in 4Q20 to 77% in 4Q22 for IRDs, and from 41% to 45% for credit. The UK remains central to derivative trading in Europe, with 52% of outstanding notional amounts in EEA-to-UK contracts (+3ppt from 4Q20). EEA exposures to other third counties also grew (22%, +3ppt).

Growth across asset classes

At the end of 2022, the total notional amount outstanding in the EEA derivatives market stood at EUR 314tn, held in 27mn open derivative positions. The total notional amount increased in the previous two years, by 14% in 2021 and by 11% in 2020.\(^2\)

The increase in market size over the two-year period was driven by increases in outstanding notional amounts in all asset classes (MR-DR.1). The largest proportional increase in notional amount was in credit derivatives, which rose by 30% in 2021 and 15% in 2022. In absolute terms, however, growth was due to interest rate derivatives and to currency derivatives, the two asset classes with the largest outstanding notional amounts.

In 4Q22 exposures between counterparties in the same group, intragroup positions, accounted for EUR 44tn of the total notional amount, held in 3mn outstanding positions. This was an increase of 35% from the EUR 32tn in 4Q21, which in turn was an increase of 39% from 4Q20. The growth in intragroup notional amounts in percentage terms was more than twice that of the overall growth. The intragroup increase was also associated with growth in interest rate and credit derivative intragroup notional amounts, which given the clearing obligation applies to products in these instrument classes, may indicate changing clearing behaviour by large cross-

---

1 Statistics presented in this report are based on the reporting requirements specified in Regulation (EU) No 648/2012 of the European Parliament and of the Council of 4 July 2012, (the European Markets and Infrastructure Regulation, EMIR) and the regulatory technical standards adopted for its implementation.

Unless otherwise stated, statistics presented here are based on trade-state data, i.e. all outstanding derivatives at the end of the reference day, based on the state of each derivative along the derivatives life cycle. Statistics are presented as the number of derivatives outstanding, or the notional amount value of derivatives outstanding, with notional amount outstanding defined as the nominal or notional value of all derivatives reported and not yet terminated at the reporting date. The total notional amount is the sum of the reported outstanding notional amounts. Numbers of derivatives refer to the number of individual derivative reports, as reported under EMIR. A derivative report can be of positions that have arisen from the combining, netting or compressing individual transactions, or of individual transactions themselves, depending on the actions of the reporting counterparty. In this report we use ‘positions’ generically when referring to these derivative reports.

The reporting period for this report are the 2021 and 2022 calendar years. The statistics presented are based on reports from four reference dates per year spaced at approximately quarterly intervals subject to the availability of data from TRs, while avoiding days near to the end of quarters to avoid distortions from end-of-quarter activity (e.g. from contract expiry or rollover). The eight reference dates are 19 March 2021, 11 June 2021, 10 September 2021, 10 December 2021, 11 March 2022, 10 June 2022, 16 September 2022, and 16 December 2022.

border institutions, who manage clearing at group level to optimise access to liquidity and to reduce costs of clearing.

The **composition** of the total outstanding notional amount by asset class remained broadly stable in 2022 and 2021 (IRDs: 78%, currency: 15%, equity: 5%, credit: 2% and commodities: 1% in 4Q22). The relative proportions of open positions also remained essentially unchanged with equities (43% in 4Q22) and currencies (28% in 4Q22) continuing to account for the bulk of positions in both 2022 and 2021 (MR-DR-S.3-6).

At **product** level, interest rate swaps, currency swaps and interest rate FRAs continued to account for about 80% of the outstanding total derivative market notional amounts. While in terms of number of positions, equity CFDs and currency forwards remained the two most prevalent in both 2021 and 2022 (MR-DR-S.7-10).

The distribution of notional amount by **currency of denomination** was also similar to previous years, with most notional amounts denominated in EUR (62% by end 2022) followed by USD (25%) (MR-DR-S.13-S.14). Only commodities had a larger share of USD (49% vs 46% for EUR), though here the EUR share increased in 2022 from 32% in 2021, due in part to the very rapid increase in European natural gas prices in March and August 2022 following the Russian invasion of Ukraine, which disproportionately increased the notional amounts of natural gas contracts denominated in EUR.

The distribution of notional amount by the **maturity** for derivatives in the reporting period remained similar to previous years. Currency, commodity, and equity derivatives have the shortest maturities, each of these having at least half of their outstanding notional amount in contracts with a maturity of a year or less at execution. In contrast, credit and interest rate derivatives have a much greater prevalence of contracts with maturities of several years of more (MR-DR-S.15-16).

**Banks and investment firms continue to dominate**

Looking at the derivatives holdings by different **types of counterparties**, credit institutions hold by far the largest amount of overall notional (62% in 4Q22,+7ppt since 4Q20) with over 80% of their notional amount in interest rate derivatives and just under 15% in currency derivatives in 4Q22.

In terms of non-banks, their overall share of notional amount fell over the reporting period (48%, -7ppt) with a shift away from non-banks in all assets except commodities, and away from alternative investment funds and non-financial firms to banks in particular.

Investment firms accounted for 22% of the total outstanding notional amount in 4Q22. The split of their exposures was similar to credit institutions, with just under 80% in interest rate derivatives and 18% in currency derivatives. CCPs, which account for 7% of total notional amount, also have most exposures in interest rate derivatives (75% in 4Q22), equity (13%) and credit derivatives (5%).

Non-financial firm exposures, which account for 4% of total notional amounts had half of their exposures in interest rate derivatives, a third in currency derivatives and 10% in commodities in 4Q22. For undertakings for collective investment in transferable securities (UCITS), which account for 2% of total notional, 43% of exposures were in currency derivatives, 35% in interest rate, 12% in equity and 10% in credit. Alternative investment funds (AIFs), also 2% of total notional, had almost two thirds of their notional in interest rate derivatives, a fifth in currency, and 8% and 7% in credit and equity respectively in 4Q22. Pension funds, about 1% of total notional, had about 40% in interest rate derivatives and just under 60% in currency derivatives. Assurance and insurance accounted for just over 0.5% of total notional amount, both with about three quarters of exposures in interest rate derivatives.
The distribution of exposures across counterparty types and the distributions held by counterparty type did not show major changes during the reporting period (MR-DR-S.19-20).³

Change in status of UK trading venues increases OTC

In terms of execution method, ETD contracts – as defined under EMIR – are those executed on an EU regulated market⁴ or a third-country venue assessed to be equivalent to an EU regulated market,⁵ with the rest classified as OTC.⁶

MR-DR-2
Post Brexit developments in cross-border regulation
UK trading venue recognition ends from 2021

With the exit of the UK from the European Union on January 31, 2020 and the subsequent end of the transition period at the end of 2020, the United Kingdom has been treated as a third country from January 1, 2021 onwards.

In terms of derivative trading there were several regulatory developments leading to and during the reporting period that are relevant for interpreting cross-border derivative activity between the UK and the EU following Brexit. This box briefly summarises these, in particular those related to the EMIR clearing obligation (CO) and the MiFID derivative trading obligation (DTO).

³ As EMIR data does not identify the type of clients whose positions are invested by credit institutions or investment firms, total exposures by other counterparty types are likely to be underestimated. Distributions of exposures will also be somewhat biased due to some counterparty exposures being included under those of credit institutions and investment firms rather than their own counterparty type.

⁴ Definition, Article 4(1)(21), Markets in Financial Instruments Directive (MiFID) II.

⁵ The list of third-country markets that can be considered equivalent to regulated markets for the purposes of the definition of OTC derivatives: https://www.esma.europa.eu/sites/default/files/library/otcderivativesاتفolk.pdf. As 2020 was during the transition period, contracts executed on UK regulated markets are treated as ETD in this report.

⁶ So, derivatives are counted as OTC where the execution venue is reported with XXXX, XOFF or with a market identifier code (MIC) that is not for an EU regulated market or third-country equivalent.

⁷ A CCP established in a third country (TC-CCP) may only provide clearing services to clearing members and trading venues established in the EU, if that TC-CCP is recognised by ESMA. As part of the recognition process, ESMA is also required to tier each TC-CCP as Tier 1 or Tier 2. This recognition is reviewed when that CCP intends to extend or reduce the range of its activities and services in the Union and in any case at least every five years. Recognition is dependent on the European Commission adopting an equivalence decision for the third-country’s legal, supervisory and enforcement framework in relation to CCPs, and ESMA concluding cooperation arrangements or Memoranda of Understanding (MoU) with the relevant authorities to support supervisory cooperation and information exchange. ESMA also monitors the regulatory and supervisory developments in third-country jurisdictions for which the European Commission has adopted equivalence decisions. See the ESMA website for further details.

¹⁰ ESMA concludes Tier 2 CCP assessment under Article 25(2)(c) of EMIR, ESMA Public Statement, 17 December 2021.

¹¹ ESAs propose to adapt the EMIR implementation timelines for intragroup transactions, equity options and novations to EU counterparties, ESMA Press Release, 23 November 2020.

¹² ESAs propose extending temporary exemptions regime for intragroup contracts during EMIR review, ESMA Press Release, 13 June 2022.

¹³ In accordance with Article 28(1)(d) of MiFIR, counterparties may also fulfil the DTO by trading on a trading venue established in a third-country in respect of which the European Commission has adopted an equivalence decision and provided that the third country provides for an effective equivalent system for the recognition of trading venues. Article 28 MiFIR, ESMA Interactive Handbook, accessed 18 August 2023.

Moreover, further changes came into effect in May 2022 to the products subject to the DTO as a consequence of the ongoing global transition to risk-free rate benchmarks. As a result, classes of interest rate derivatives denominated in GBP and USD were removed from scope. \(^{16}\) Thus, for the DTO there were two main developments during the reporting period, the end of UK trading venues providing services in the EEA at the start of 2021 and the removal of GBP and USD interest rate derivatives from DTO scope in May 2022.

However, in addition to regulated markets there are also two other forms of trading venue: multilateral trading facilities (MTFs) and organised trading facilities (OTFs). These both offer high levels of market transparency, standardisation and liquidity, similar to regulated markets. So, OTC derivatives on trading venues i.e. on MTFs or OTFs are arguably more like ETDs than conventional OTC contracts executed bilaterally. \(^{17}\) For this reason, we treat them separately in the statistics below.

Adding complexity in this reporting period is that following the UK exit from the EU, the recognition of UK trading venues lapsed in 2021 (see MR-DR.2). Thus, in what follows, categorisation of a position executed on UK venues also depends on when that position was executed. Positions executed before 2021 on a UK venue assessed to be equivalent to a regulated market are ETD, while those executed prior to 2021 on a UK venue that was equivalent to an MTF or OTF are off-venue OTC. In contrast, positions executed on UK venues in 2021 or later are classified as off-trading-venue OTC.

Turning to the statistics, the proportion of notional amount in outstanding OTC contracts rose over the reporting period, from 92% in 4Q20 to 94% in 4Q21 and to 95% in 4Q22 (MR-DR.3). ETD correspondingly fell to 6% in 4Q21 and then to 5% by 4Q22 (-3ppt since 4Q20). On-venue OTC also fell sharply to 11% in 4Q22 (-5ppt since 4Q20). \(^{18}\) A significant share of the decrease (5ppt) was associated with positions executed on UK trading venues that were no longer being recognised as such after Brexit (1ppt of the fall in ETD and 4ppt of the fall in OTC on-trading venue). This is in line with expectations and reflects a change of categorisation rather than a substantive change in the nature of trading.

---

\(^{16}\) Public Register for the Trading Obligation for derivatives under MiFIR, ESMA, 15 September 2022

\(^{17}\) In what follows, we described OTC derivatives traded on MTFs or OTFs as ‘on trading venue’; other OTC contracts traded bilaterally are described as ‘off trading venue’. This terminology follows the EMIR definition of OTC, which may not be consistent with MiFID II usage. In MiFID II contexts, OTC can exclude contracts traded on trading venues. This is the case, for example, in the ESMA Questions and Answers on MiFID II and MiFIR investor protection and intermediaries topics (see p.19, fn.10), available at: https://www.esma.europa.eu/sites/default/files/library/ESMA35.43.349_mifid_ii_gas_on_investor_protection_topics.pdf

\(^{18}\) Exchange-traded derivatives (ETDs) are standardised contracts with transparent characteristics and prices, whose use encourages market participation, increases liquidity and helps to improve market efficiency. In contrast, OTC derivatives are executed bilaterally with features that can be tailored to the two counterparties and thus are more opaque to the market. For that reason, the split between OTC and ETDs is an important indicator of transparency, standardisation and liquidity in derivatives markets. See: https://www.esma.europa.eu/post-trading/clearing-obligation-and-risk-mitigation-techniques-under-emir

---
from 4Q20) and 50% for credit derivatives (+4ppt). This continues the trend seen in previous reports, reflecting how uncleared derivatives have continued to be replaced by newer contracts that are centrally cleared for products subject to the clearing obligation.  

Central clearing of OTC derivatives in other asset classes remained lower (currencies: 1% (as in 4Q20), commodities: 9% (+8ppt) and equities: 5% (+3ppt)).

Exposures mostly in a few very connected counterparties

Concentration and interconnectedness remain important features for assessing financial stability risks in derivative markets. Greater concentration, where few counterparties account for a large share of market activity, increases financial stability risks associated with a failure or disruption at one or more of these entities. While greater interconnectedness increases the risk of contagion, that disruption will spread widely and affect large numbers of counterparties.

Concentration remains high across asset classes, as in previous years. The share of outstanding notional amount held by the top five largest counterparties (excluding CCPs) was close to half in all assets in 4Q22 (commodities: 40% (-4ppt from 4Q20), credit 49%: (+4ppt), currencies: 52% (+11ppt), equities: 47% (-1ppt) and interest rates: 45% (+4ppt). When CCPs are included the share for equity, credit and interest rises. For equities this reflects the clearing of ETD derivatives, for credit and interest rates it relates to the clearing of OTC derivatives as mandated by the clearing obligation. A second metric of concentration, the HHI (the normalised sum of the squares of the distribution of notional amounts) also shows similar patterns as the top 5 metric (MR-DR.4).

These metrics show that across all assets, the bulk of outstanding of positions are held by a few, very significant counterparties, with many counterparties having relatively small positions.

The patterns of interconnectedness in derivative markets aligns with the high concentration. As in previous years, the top 0.01% most connected21 reporting counterparties in each asset class have extremely large numbers of connections in all asset classes (MR-DR.5), for example, in commodities the most connected counterparty was a party in 37% of connections.

Looking at the different asset classes, we see that connections are – like notional – concentrated in

---

21 A connection is counted when a reporting counterparty reports an outstanding position with another counterparty.
relatively few counterparties. Commodities and equities are most extreme, followed by currencies, interest rate and credit derivatives. And while there is some variation year-by-year, the picture overall, like concentration, remains that of a concentrated market where a few market participants are central to the market, holding the most notional amount, they are highly connected to one-another through numerous positions and also to other very numerous peripheral players, who often have relatively few positions and connections.

**UK remains central to European derivative trading**

With Brexit, the UK regime for derivative markets started to diverge from that of the EU, increasing risks related to diverging regulatory regimes. The potential for such risks increases the greater the extent to EU derivative markets take place in UK or other third-country jurisdictions with different regulatory regimes. Monitoring the geography of exposures is thus important, particularly the UK, given its historically important role in both EU and global derivative markets.

In terms of the geographical network of derivative market activity, *intra-EEA exposures* in 2021 and 2022 remained similar to 2020 in all asset classes. France (FR) and Germany (DE) are generally the member states with the largest exposures, with the Netherlands (NL) also relatively significant in equities and currencies.

Exposures between EEA counterparties and those domiciled in *third countries*\(^{23}\) show that the United Kingdom continues to play a central role in EU derivative markets, with 52% of notional held in EEA-to-UK contracts (+3ppt from 4Q20). EEA exposures to other third counties also grew (to 22%, +3ppt). This is mainly driven by interest rate derivatives (59% of contracts are in EEA-to-UK), though the proportions are also sizeable in other asset classes (commodities: 25%, credit: 41%, currencies: 22%, equities: 31%).

The tables below show that over the whole market, exposures involving third countries accounted for almost three quarters of the total notional outstanding in both 4Q21 and 4Q22 (MR.DR.6-7). Exposures to the UK were the largest, at just over half of the notional amount, up 4ppt at the end of 2022 from the end of 2020. Exposures within the EEA accounted for a quarter, 25% (up 1ppt), while those to other (non-UK) third countries accounted for just over a fifth (22%, +2ppt). The EEA-to-third country share is significant in all asset classes, ranging from just over a half in commodities to over three quarters for interest-rate derivatives.

Interest rate derivatives

Summary

The IRD market grew substantially, by 26% in outstanding notional amounts, to EUR 244tn in 4Q22, up EUR 51tn since 4Q20. A third of the growth was in intragroup positions, whose notional amounts grew 121% to EUR 31tn (4Q22) from 14tn (4Q20), mainly in interest rate swaps held with UK and other third-country counterparties subject to the clearing obligation. Shares held by credit institutions (65%, +7ppt from 4Q20) and investment firms grew (23%, +4ppt) while shares for AIFs (1%, -8ppt) and non-financials (2%, -2ppt) fell, with intragroup growth for both credit institutions and investment firms. OTC positions rose significantly, to 97% in 4Q22 from 93% in 4Q20. Both ETD (3%, -4ppt from 4Q20) and in OTC executed on an MTF or OTF fell (13%, -4ppt). A sizeable part of this shift was due to UK venues ceasing to be recognised after 2020, affecting the status of trades subsequently executed on these venues. Central clearing of outstanding IRDs continued since 4Q20, from 71% to 77%, while quarterly clearing rates for the IRDs subject to the clearing obligation, IRDs in G4 currencies and IRDs in NOK, SEK and PLN were both near 100%.

Strong growth, particularly in intragroup positions

Interest rate derivatives (IRDs) are the largest derivative asset class, consistently accounting for about three quarters of the outstanding notional amount for all derivatives. Over 2021 and 2022, the IRD market grew substantially in size in notional amounts outstanding, by 26%, to EUR 244tn in 4Q22, up EUR 51tn since 4Q20. It peaked in 2Q22 at EUR 256tn. The total number of outstanding positions in 4Q22 was 4mn, similar to 4Q20.

Growth was particularly striking for intragroup positions, where notional amounts grew 121%, to EUR 31tn (4Q22) from 14tn (4Q20). As shown in the chart below, intragroup growth in 2021 and 2022 occurred in contracts held with UK and other third-country counterparties (MR-DR.8).

At product level, the growth in both intragroup and other contracts was driven by interest rate swaps, whose notional amount was up EUR 53tn. Growth in intragroup swap notional amounts was particularly significant, up EUR 18tn. Following this growth, by 4Q22 swaps accounted for 75% of all IRD outstanding notional amounts (+8ppt from 4Q20). Forward rate agreements accounted for 13% (+3ppt), swaptions 5% (unchanged), options 4% (-1ppt), and futures 2% (-2ppt) by 4Q22.

Compared to the strong growth in swaps, and in intragroup swaps in particular, other metrics were generally more stable through the reporting period. Distributions of maturities, for example, both remaining and at execution, remained generally stable, with about two fifths of IRD contracts having maturities of over 5 years at execution, two fifths between and one and five years, and the remaining fifth less than one year (MR-DR-S.52-53).

In the distribution of currency of denomination for notional amounts, there was a shift to EUR contracts, away from USD and GBP. By 4Q22, 64% (+8ppt) of notional amounts were denominated in EUR, 21% in USD (-4ppt), 3% in GBP (-4ppt), with amounts in other currencies relatively small (MR-DR-S.13-14).
There were also some discernible trends in the notional amounts held by counterparty type. The shares held by credit institutions and investment firms both showed clear growth. Credit institutions finished 2022 at 65% (+7ppt from 4Q20), with investment firms at 23% (+4ppt). While there was a shift away from AIFs (1%, -8ppt) and non-financials (2%, -2ppt). The growth in both credit institutions and investment firms was also largely driven by swaps, with intragroup swaps growing strongly for both counterparty types.

Looking at counterparty exposures to one another among EU-based counterparties, shows the main exposures in notional amounts to be between credit institutions, between credit institutions and investment firms, and between credit institutions and CCPs. Outstanding positions in these categories accounted for well over half of total outstanding notional amounts between EU counterparties in both 4Q21 and 4Q22 (MR-DR-S.67-68).

**Execution on trading venue falls linked to UK change**

In terms of venues of execution, the share of outstanding notional in OTC positions rose significantly, to 97% in 4Q22 from 93% in 4Q20. There were falls in both ETD (3%, -4ppt from 4Q20) and in OTC executed on a trading venue, an MTF or OTF, (13%, -4ppt). Off-venue OTC rose correspondingly (84%, +7ppt). Much of these changes were due to UK venues ceasing to be recognised after 2020, affecting the status of trades subsequently executed on these venues.

As shown in the chart below (MR-DR.9), there is steadily increasing OTC associated with UK trading venues that were previously assessed as equivalent. The gradual increase likely reflects the fact that contracts that were executed before 2021 remain OTC on-venue, thus OTC off-venue grows as contracts that were executed on UK venues prior to 2021 are gradually replaced by contracts executed after the end of recognition.

The chart also shows a fall in notional outstanding executed on UK venues in 2021, which was driven largely by falls in interest rate swaps executed on venues there. In contrast, notional amounts outstanding for swaps executed on venues located in the EEA or US rose over the reporting period. This drop in notional amounts is consistent with media reports of significant migration of interest rate swaps from UK venues to US SEFs (Swap Execution Facilities) early in 2021, after Brexit came into force and UK venues ceased to be recognised for the purposes of the DTO.24

**High central clearing rates, though with intragroup growth**

Central clearing of outstanding IRDs continued to grow since 4Q20, from 71% to 77%. Quarterly clearing rates for the IRDs subject to the clearing obligation IRDs in G4 currencies and IRDs in NOK, SEK and PLN were both near to 100%. For the IRDs in G4 currencies 88% on average was cleared in the UK, while for IRDs in NOK, SEK, PLN the figure is 96% (MR-DR-S.57-60).

The clearing metrics above do not include intragroup transactions, which are subject to a continuing exemption from the clearing obligation. Interestingly, the chart above shows a significant increase in the outstanding notional amounts of IRDs in G4 currencies in intragroup transactions to both the UK and third countries.

---

The increase to the third countries is mainly to the US and driven by one large credit institution, where the UK increases are spread among several large credit institutions. The intragroup increase here also accounts to a large extent for the increase in intragroup notional in interest rate swaps and interest rate derivatives more generally (MR-DR-10).

The growth in intragroup may also represent the microstructure of clearing, where derivatives are cleared by one entity in a group with, depending on the costs and the location of the CCP, the entity doing the clearing either being in the EU, the UK or a third country. The investment banks which are clearing, either voluntarily or mandated, also have incentives to use the cheapest and/or most liquid pool. Thus, for such firms, it makes sense to use intragroup transactions with the entity responsible for clearing to manage its clearing needs for the group with the CCP that the entity clears with.

In addition, the intragroup exemption to the derivative trading obligation is likely to have enabled actions by global counterparties to continue to comply with the DTO following the expiry of recognition of UK venues with the coming into force of Brexit. For example, a firm which before 2021 could have complied with the DTO by executing at a recognised UK venue. After 2021, with this no longer being an option, it could choose to open an intragroup transaction with a UK subsidiary which in turn could open the position with the original UK venue. In this way, the expiry of the recognition of the UK venues for the purposes of the DTO, alongside the intragroup exemption, are likely to have contributed to increases in intragroup positions.

For IRDs in NOK, SEK and PLN, a similar trend is seen for intragroup transactions to third countries rather than the UK, though absolute amounts are much smaller, reflecting of the smaller size of these instruments. It cannot be assessed from EMIR data whether the intragroup entities based in the UK and third countries have corresponding uncleared positions with other non-EEA counterparties as these fall out of the scope of EMIR reporting.

Increasingly concentrated and interconnected market

Concentration showed an upward trend during the reporting period. The share of notional amount held by the top five largest counterparties, excluding CCPs, grew to 45% (+3 ppt from 4Q20), as did the HHI index (excl. CCPs) which grew by 15% to 0.056. There was also a spike in both metrics in 2Q22. (MR-DR-S.61).

In addition, interconnectedness also increased slightly. Degree connectedness, a metric based on the number of counterparties every participant has, grew by 1%. While eigenvector centralization, a measure of the tendency of participants to be exposed to other central participants through how well connected participants tend to be, and how many links these connections in turn have, grew by 5% (MR-DR-S.65-66).

In terms of the geography of exposures, 77% of the outstanding notional amount was in contracts
between EEA counterparties and those in third countries, 59% (+4ppt since 4Q20) in EEA-to-UK contracts and 17% (+2ppt) in EEA-to-other-third-countries (MR-DR.12). Of the remaining outstanding notional amount for interest rate derivatives held in contracts between EEA counterparties (22%, +1ppt), the bulk is among counterparties within and between Germany, France and the Netherlands (MR-DR-S.69-70). The geographical patterns of exposures remained similar in 2021 and 2022.

Global network involving an EEA counterparty 4Q22

Note: Undirected network of total notional amount outstanding for interest rate derivatives as of 4Q22. The size of the bubbles is proportional to the total notional amount outstanding for counterparties domiciled in the Member State. The thickness of the line is proportional to the total notional amount outstanding between counterparties from the two Member States.

Sources: TRs, GLEIF, ESMA.
Credit derivatives

Summary
Credit derivatives grew significantly, to EUR 7tn in notional amounts outstanding, from EUR 5.7tn in 4Q20. Growth was throughout the reporting period and driven by credit default swaps (CDS) which remain by far the dominant instrument. Growth in intragroup positions was dramatic, quadrupling to EUR 1.1tn (4Q22), accounting for about half of the notional growth overall and almost entirely in swaps, i.e. CDS, and mainly in contracts held with UK (up EUR 0.5tn) and other third-country counterparties (up EUR 0.3tn). The OTC share rose sharply to over 99.7% in 4Q22 from 95% in 4Q20, with falls in both ETD (0.3%, -5ppt from 4Q20) and in on-venue OTC (7%, -2ppt). Again, much of this was related to the change in status of UK venues. Central clearing of outstanding credit derivatives grew from 41% in 4Q20 to 50% in 4Q22 and quarterly clearing rates for the CDS on European indices subject to the clearing obligation averaged around 85%, with clearing predominantly at UK CCPs.

Very strong growth, especially in intragroup
Credit derivatives, relatively small in outstanding notional amount terms at about 2% of total derivative notional amount, grew significantly in both 2021 (up 5% from 4Q20 to 4Q21) and 2022 (up 12% from 4Q21). By 4Q22, total notional amount outstanding was EUR 7tn, up from EUR 5.7tn in 4Q20. The total number of outstanding positions in 4Q22 also grew, to 0.39mn from 0.35mn in 4Q20.

Growth was pretty consistent throughout the reporting period and driven by credit default swaps (CDS) which remain by far the dominant instrument (Charts MR-DR-S.73-74), accounting for 85% outstanding of notional and 90% of outstanding positions.

Growth in intragroup positions was even more dramatic for credit derivatives than for interest rate derivatives. Intragroup notional amounts quadrupled to EUR 1.1tn (4Q22) from EUR 0.2tn (4Q20), accounting about half of the growth in overall credit notional amount. As with interest rate derivatives, the intragroup growth was almost entirely in swaps, i.e. CDS, and in contracts held with UK (up EUR 0.5tn) and other third-country counterparties (up EUR 0.3tn), as shown in the chart above (MR-DR.13). The potential drivers for the growth in intragroup are likely to be similar to those for interest rate derivatives, for example, the expiry of the recognition of the DTO for UK venues is likely to have contributed to growth in intragroup positions used to facilitate indirect transactions to previously recognised UK venues through UK-based subsidiaries.

Distributions of maturities, both remaining and at execution, showed stable trends, with about one fifth of contracts having maturities of less than one year at execution, one fifth having maturities of 1-to-5 years and the remaining 15% or so having maturities over five years (MR-DR-S.77).

In terms of currency of denomination, the split by notional amounts outstanding was about 60% in EUR to 40% in USD by notional amount in 4Q21 and 4Q22, similar to 4Q20 (MR-DR-S.13-14).

In the split by counterparty type, the share held by credit institutions grew significantly during the reporting period, to 48% in 4Q22 from 36% in 4Q20, the share held by investment firms also grew from 16% to 18%, and from 14% to 18% for CCPs. The increase in share for credit institutions and investment firms is likely to be in part

Note: Credit derivative outstanding intragroup notional amount outstanding in EUR tr. 
Sources: TRs, ESMA.
associated with the growth in intragroup transactions, which are almost entirely held by these counterparties (MR-DR-S.75).

As regards counterparty exposures to one another among EU-based counterparties, the main exposures in notional amounts outstanding terms were between credit institutions and CCPs, between credit institutions and investment firms, and among credit institutions themselves. Smaller but still sizeable were exposures between credit institutions and AIFs. Patterns remained similar in both 4Q21 and 4Q22 (MR-DR-S.89-S90).

Central clearing grows, remains mainly at UK CCPs

In terms of venues of execution, the share of outstanding notional in OTC positions rose sharply to over 99.7% in 4Q22 from 95% in 4Q20, with falls in both ETD (0.3%, -5ppt from 4Q20) and in on-venue OTC (7%, -2ppt). Off-venue OTC rose correspondingly (93%, +7ppt). About 4% of the outstanding credit notional amount in 4Q22 was traded OTC on UK venues, MTFs and OTFs that are no longer recognised, thus contributing strongly to the drop. In contrast, the ETD trading fall is associated in a drop in the trading of credit futures, rather than a change in the status of venues (MR-DR-14).

Clearing remains largely in UK with 54% on average cleared quarterly in UK vs 13% in EEA. And, as seen with interest rate derivatives, there was a significant increase in the uncleared outstanding notional amounts of CDS on EU indices in intragroup transactions to both the UK and third countries (MR-DR.12). Growth was particularly striking to the UK. However, unlike interest rate derivatives, here the growth in intragroup amount held in products subject to the clearing obligation account for only a relatively small share of the overall intragroup increase.

As with interest rate derivatives, EMIR data does not permit an assessment of whether the intragroup entities based in the UK and third countries have corresponding uncleared positions with other non-EEA counterparties, as these fall outside the scope of EMIR reporting.

Concentration grows, interconnectedness trends mixed

Concentration grew substantially during the reporting period for credit derivatives. The share of notional amount held by the top five largest counterparties, excluding CCPs, grew to 49% (+5ppt from 4Q20), as did the HHI index (excl. CCPs) which grew by 22% to 0.096. Growth in both metrics was gradual throughout the reporting period (MR-DR-S.83).

Central clearing of outstanding credit derivatives grew from 4Q20 to 4Q22, from 41% to 50%. Quarterly clearing rates for the CDS on European indices subject to the clearing obligation averaged around 85% (Charts MR-DR-S.57-60).
tended to have more connections, the new connections tended not to be with participants who were themselves highly interconnected.

In terms of the geography of exposures, 76% of the outstanding notional amount was in contracts between EEA counterparties and those in third countries, 41% (+5ppt since 4Q20) in EEA-to-UK contracts and 36% (+7ppt) in EEA-to-other-third-countries. For credit derivatives held in contracts between EEA counterparties (21%, unchanged) the bulk is held in contracts with counterparties within and in between France and Germany (MR-DR-15). Geographical patterns of credit derivative exposures within and outside the EEA remained similar in 2021 and 2022.
Equity derivatives

Summary
Equity derivative notional amounts increased 36% to EUR 15tn in 4Q22, from EUR 11tn in 4Q20, with growth mostly in equity options. Equity options also drove a significant increase in the share of notional amounts in ETD (58% 4Q22, +8ppt from 4Q20) which, with an increase in central clearing for OTC derivatives to 5% (+3ppt), increased the share held by CCPs (18%, +16ppt) and increased concentration in the market. By the end of 2022, over half of notional amount was also in contracts with third countries, 31% (+9ppt) to the UK and 22% (-2ppt) to other third countries. While among EEA counterparties, most notional amounts were in contracts held between counterparties based in Germany, France, and the Netherlands, with geographical patterns of exposures remaining similar in 2021 and 2022.

Growth driven mainly by equity options
Equity derivative notional amounts increased by 36% to EUR 15tn in 4Q22, from EUR 11tn in 4Q20. Numbers of positions, however, fell to 7.6mn from 10mn. Growth in notional amounts occurred throughout most of the reporting period, peaking in 2Q22. In addition, growth was almost entirely due to equity options, which continue to account for the most notional amount (63% as of 4Q22). Equity options grew in notional amounts to EUR 9.1tn from EUR 5.7tn. Futures, the second largest instrument type by notional amount, also grew, though less significantly, from EUR 1.9tn to EUR 2.1tn. Equity swaps likewise grew, from EUR 1.5tn to EUR 1.7tn (MR-DR-16).

CFDs increased in number of positions and remain the most numerous instruments, at 5.9mn, almost double the 3mn of 4Q20. These account for 51% of equity positions and 22% of all derivative positions. However, in terms of notional amounts CFDs remain relatively small in share and actually shrank in size during the reporting period, from EUR 0.2tn to EUR 0.1tn.

Maturities at execution lengthened, with a shift away from maturities of a year or less (48%, -6ppt from 4Q20) and over five years (12%, -2ppt) towards those of between one and five years (40%, +7ppt).

As regards the currency of denomination of contracts, the split by outstanding notional amount in 4Q22 was 56% (+9ppt) in EUR, 27% (-4ppt) in USD, 4% (-1ppt) in JPY, and 3% (-1ppt) in GBP (MR-DR-S.13-14).

Increase in ETD share and share held by CCPs
In the split by counterparty type, the share held by credit institutions grew during the reporting period, to 38% in 4Q22 (+5ppt from 4Q20), while the share held by investment firms fell to 31% (-9ppt), CCPs share grew very significantly to 18% (+16ppt), while NFCs held 5% (-6ppt). The large increase in CCPs is likely to be due to growth both in ETD (+8ppt), and in the share of cleared OTC (+3ppt). (MR-DR-S.97).

Counterparty exposures to one another among EU-based counterparties, were dominated by exposures among credit institutions and between credit institutions and investment firms, and between credit institutions and CCPs accounting for over half of all notional amounts in 4Q21 and 4Q22. There was,

Unlike interest rate and credit derivatives, intragroup amounts for equity derivatives remained largely unchanged at EUR 3.4tn in 4Q22 (vs EUR 3.3tn in 4Q20).
however, a notable shift away from exposures between credit institutions, to exposures between credit institutions and investment firms in 2022. (MR-DR-S.109-S110).

Exchanges were the dominant venue of execution, with the ETD proportion of outstanding notional amount rising over the reporting period (58% 4Q22, +8ppt), driven by the large increase in equity options in 2021. ETD’s accounted for almost all of the share executed on trading venues, with the share of on-venue OTC remaining negligible (MR-DR.17).

Greater concentration, partly linked to CCP growth

Concentration grew during the reporting period. While the share of notional amount held by the top five largest counterparties, excluding CCPs, fell slightly to 47% (-1 ppt from 4Q20), the HHI index (excl. CCPs) which takes into account all counterparties, grew by 35% to 0.067. Moreover, the share of top 5 including CCPs grew substantially, to 61% (+13ppt). So, with the exception of a fall in the top-5 share excluding CCPs at the beginning of the reporting period, concentration metrics also grew throughout 2021 and 2022. (MR-DR-S.103).

Interconnectedness metrics were mixed. Degree connectedness grew by 23%, indicating a marked increase in the number of connections market participants tended to have with others. However, eigenvector centralization fell by 6%, suggesting that these increasing connections did not generally increase the wider connectivity of participants across the network (MR-DR-S.107-108).

In terms of the geography of exposures, 53% of the outstanding notional amount was in contracts between EEA counterparties and those in third countries,31% (+9ppt since 4Q20) in EEA-to-UK contracts and 22% (-2ppt) in EEA-to-other-third-countries. Of the remaining outstanding notional amount for equity derivatives held in contracts between EEA counterparties (46%, -4ppt), the bulk is among counterparties within and between Germany, France and the Netherlands, and to a lesser extent Luxembourg and Spain (MR-DR-S.111-112). The geographical patterns of exposures remained similar in 2021 and 2022.
Currency derivatives

Summary
Currency derivative notional amounts grew by 41% to EUR 45tn in 4Q22, from EUR 32tn in 4Q20. Growth occurred throughout most of the reporting period, peaking in 3Q22 and was mainly from forwards, which continue to be the largest instrument by notional amount (72% as of 4Q22). Swaps and options likewise grew. Their growth was accompanied by a shift to credit institutions, 62% in 4Q22 (+10ppt from 4Q20) and investment firms (17%, +1ppt) away from other firm types. The shift was accompanied by increasing concentration throughout the period. There was also a slight shift towards notional in contracts with non-UK third countries (46%, +3ppt) while those with UK counterparts remained unchanged (22%). Patterns within the EEA remained relatively dispersed compared to other assets, and dominated by Germany, France and the Netherlands.

Growth in forwards, swaps and options
Like other assets, currency derivative notional amounts grew significantly, increasing by 41% to EUR 45tn in 4Q22, from EUR 32tn in 4Q20. Numbers of positions, also grew, to 7.5mn from 7.2mn. Growth in notional amounts occurred throughout most of the reporting period, peaking in 3Q22 (MR-DR-18).

In addition, growth was largely due to growth in currency forwards, which continue to account for the most notional amount (72% as of 4Q22). Currency forwards in notional amounts to EUR 9.1tn from EUR 5.7tn. Swaps, the second largest instrument type by notional amount, also grew, though less significantly, from EUR 4.4tn to EUR 5.9tn. Currency options likewise grew, from EUR 3.8tn to EUR 5.2tn.

Intragroup amounts for currency derivatives grew by 38% to EUR 6.9tn in 4Q22 from EUR 5tn in 4Q20. Unlike interest rate derivatives and credit derivatives, the intragroup growth was similar in scale to growth in non-intragroup derivatives.

Maturities showed little change, with a slight shift in maturities at execution towards those of a year or less (84%, +1ppt from 4Q20) from those with maturities of over five years (22%, -1ppt).

The currencies of denomination of contracts was broadly unchanged from 4Q20. The split by outstanding notional amounts in 4Q22 was 66% in EUR (unchanged), 32% in USD (+1ppt) (MR-DR-S.13-14).

In the split by counterparty type, the share held by credit institutions grew substantially during the reporting period, to 62% in 4Q22 (+10ppt from 4Q20), a shift from non-financial firms (9%, -5ppt), UCITs (5%, -3ppt), AIFs (2%, -3ppt) and pension funds (1%, -1ppt), investment firms grew to 17% (+2ppt). (MR-DR-S.117).

Counterparty exposures to one another among EU-based counterparties, were dominated by exposures among credit institutions, between credit institutions and CCPs, and between credit institutions and investment firms. These accounted for over two thirds of all notional amounts in positions between EU counterparties, in both 4Q21 and 4Q22. (MR-DR-S.129-S130).

ETD remains very small, OTC on trading venue falls
In terms of execution, the ETD proportion remained low and unchanged over the reporting period (1.1% in 4Q22), though it rose higher in
2021, peaking at 2.2% in 3Q21 before falling back down (MR-DR-S.121). The share of on-trading-venue OTC fell from 16% in 4Q20 to 9% in 4Q22. The fall was attributable to OTC contracts continuing to be traded on UK MTFs and OTFs that lost recognition as equivalent trading venues at the start of 2021.

Central clearing of OTC currency derivatives rose slightly over the reporting period, though remained very low. It had risen to 1.3% by 4Q22 (+0.2ppt from 4Q20, MR-DR-S.122).

Increased concentration

Concentration grew steadily throughout the reporting period. The share of notional amount held by the top five largest counterparties grew strongly to 52% (+11 ppt from 4Q20) and the HHI index (excl. CCPs) also grew by 35% to 0.068. (MR-DR-S.123). Interconnectedness metrics, however, were mixed. Degree connectedness grew by 7%, while eigenvector centralization fell by 8%, suggesting increasing connections that did not translate into greater wider connectivity of participants through being more connected in turn to more highly-connected participants (MR-DR-S.127-128).

In terms of the geography of exposures, 68% of the outstanding notional amount was in contracts between EEA counterparties and those in third countries, 22% (unchanged since 4Q20) in EEA-to-UK contracts and 46% (+3ppt) in EEA-to-other-third-countries. Of the remaining outstanding notional amount for currency derivatives held in contracts between EEA counterparties (30%, +3ppt). While positions are more dispersed across Europe than in other assets, the bulk is again among counterparties within and between Germany, France and the Netherlands (MR-DR-19, MR-DR.S131). Also, as with other derivative asset classes, geographical patterns of exposures remained similar in 2021 and 2022.

Note: Undirected network of total notional amount outstanding. The size of the bubbles is proportional to the total notional amount outstanding for counterparties domiciled in the Member State. The thickness of the line is proportional to the total notional amount outstanding between counterparties from the two Member States. Sources: TRs, GLEIF, ESMA.
Commodity derivatives

Summary
Commodity derivative notional amounts grew 65% in the reporting period, to EUR 3.3tn in 4Q22 from about EUR 2tn in 4Q20. Growth was steady, peaking at 3Q22 at EUR 3.6tn, and was across the largest instruments: swaps, futures, and options. This was fuelled by the Russian invasion of Ukraine in February 2022 increasing commodity prices in 2022, particularly natural gas, and correspondingly increasing notional amounts of new contracts. The share of ETD fell over the reporting period (39% in 4Q22, -10ppt from 4Q20), OTC grew correspondingly to 61%. OTC trading activity grew as prices rose in 2022, part of which may be due to higher margin costs at CCPs during periods of higher prices. Central clearing of OTC finished unchanged at 9% by 4Q22 (unchanged from 4Q20). Central clearing was predominantly in the UK (averaging 91% cleared in the UK).

Growth in main instruments: swaps, futures and options
Commodity derivative notional amounts grew very significantly in the reporting period, to EUR 3.3tn in 4Q22 from about EUR 2tn in 4Q20. Growth was steady throughout, peaking at 3Q22 at EUR 3.6tn. The 65% growth in notional amounts over 2021 and 2022 was across the largest instruments: commodity swaps (+EUR 0.5tn), futures (+EUR 0.5tn) and options (+EUR 0.2tn). (MR-DR-19).

Intragroup notional amounts grew even more proportionally, to EUR 1.1tn from EUR 0.6tn, with almost all of the increase due to intragroup commodity swaps, which grew by EUR 0.4tn.

CFDs also increased in number to 1.5mn positions, up from 1mn of 4Q20, with 2.2mn peak (1Q22), but fell by 23% in notional amount size, down to EUR 21bn.

Russian invasion drove prices and notional amounts up
The growth in notional amounts was partly driven by the Russian invasion of Ukraine in February 2022 which impacted commodity prices in 2022, and in particular, natural gas, which experienced price surges in March and August 2022, and reached record prices in late summer. As the notional amounts of new contracts rise with price, part of the notional amount growth is due to the price rises in the underlying commodities.

For contract maturities, there was a shift away from contracts with maturities of a year or less. By 4Q22, 49% (-3ppt) of contracts had a maturity at execution of a year or less, 44% (unchanged) had maturity of between one and five years, and 7% (+3ppt) had maturities of over five years (MR-DR-S.139).

In terms of the currency of denomination, there was a very sizeable shift from USD contracts to

Commodities here include the full range of commodities, where these fall under EMIR reporting requirements, including for example, energy, agricultural, metals in addition to others.

See the TRV article, The August 2022 surge in the price of natural gas futures.

See TRV 2-22, ESMA (September 2022) and TRV 1-23, ESMA (February 2023) for detailed discussions of financial market impacts of the Russian invasion and its associated risks.
EUR contracts in 2022, likely associated with the large increase in natural gas prices in EUR denominated contracts in 2022. By 4Q22, 46% (+23ppt) of outstanding notional amounts were in contracts denominated in EUR, 40% (-19ppt) in USD and 4% (-4ppt) in GBP (MR-DR-S.13-14).

As regards counterparty type, investment firms, NFCs and credit institutions continued to hold the most notional at 38% (+8ppt) 37% (-1ppt) and 18% (-5ppt) of overall notional amounts respectively, with a noticeable shift in holdings from credit institutions to investment firms.

Counterparty exposures to one another among EU-based counterparties were dominated by exposures between credit institutions and non-financial companies, followed by exposures between credit institutions and investment firms, NFCs and investment firms and between NFCs themselves. Despite dramatic changes in the commodity markets in 2022, relative exposures remained similar across 2021 and 2022. (MR-DR-S.150-151).

ETD share fell over the period

As regards venues of execution, the share of notional amounts outstanding that were executed as ETD fell sharply over the period (39% in 4Q22, -10ppt from 4Q20, MR-DR-20). OTC grew correspondingly to 61%, with the increase in OTC due in part to sharp price rises in commodity derivative markets, observed until end-August 2022, and the corresponding increase in margin requirements on regulated markets, which were associated with a migration of derivative transactions to non-cleared OTC markets.28

Another likely part of the growth in OTC share is that OTC contracts tend to have longer maturities than ETD, so the price effect of notional amounts is more persistent for these than for ETD and so raises their notional amount share outstanding.

The share of on-trading-venue OTC also fell from 16% in 4Q20 to 0% in 4Q22. As seen with currencies and many other assets, the fall was also attributable to OTC continuing to be traded on UK MTFs and OTFs that lost their recognition as equivalent trading venues at the start of 2021.

Central clearing of OTC finished 2022 at 9% (as in 4Q20). OTC central clearing remained predominantly in the UK throughout the reporting period (averaging 91% of cleared OTC notional being cleared in the UK).

Concentration metrics were mixed. The top 5 share of notional amounts ended 2022 at 40% (-4ppt from 4Q20). In contrast, the HHI metric (excluding CCPs) grew 17% to 0.05. (MR-DR-S.143) So, there is no clear concentration trend in the reporting period for commodity derivatives.

Interconnectedness grew during the reporting period. Degree connectedness grew strongly, by 39% over the reporting period, indicative perhaps of growth in market activity following the Russian invasion (MR-DR-S.147). Eigenvector centralization, however, grew just by 1%, suggesting the increased connections did not translate to much greater interconnectivity of the network as a whole (MR-DR-S.148).

In terms of the geography of exposures, 51% of the outstanding notional amount was in contracts between EEA counterparties and those in third countries, 25% (-4ppt since 4Q20) in EEA-to-UK contracts and 26% (-5ppt) in EEA-to-other-third countries. Of the remaining outstanding notional amount for commodity derivatives held in contracts between EEA counterparties (46%, +11ppt), the bulk of exposures are among counterparties within France and Germany, between Germany and France, between France and Spain, and also between Denmark and Sweden (MR-DR-S.152-153). As with other derivative asset classes, geographical patterns of exposures remained similar in 2021 and 2022.

Market analysis
EU CDS markets: a review after the 2023 US banking turmoil

Summary
This chapter provides an update on the Credit Default Swap (CDS) market analysis conducted in 2020, with a specific focus on single-name CDS contracts for the EU banks and insurance companies. This is done in the context of the March 2023 market fluctuations in both these CDS and the underlying issuer’s stock prices, at the time of the US regional bank crisis. The EU CDS market gross notional amount now stands at EUR 5tn, up from EUR 3tn in 4Q19, with a noticeable shift towards multi-name CDS contracts. Concerning trading practices, some market participants have migrated from bilateral to multilateral trading systems, while levels of central clearing are now significant, these remain concentrated among a few CCPs and clearing members. Finally, this chapter explores ‘wrong-way’ risk, where a counterparty’s credit exposure to an entity increases as that entity’s credit quality deteriorates and finds that the incidence of such risk in the context of EU banks appears to be relatively low.

Introduction
Credit Default Swap (CDS) markets allow participants to transfer credit risk through derivative contracts. These have emerged as an important tool to reallocate credit risk and to enhance financial stability. Nevertheless, the CDS market came under scrutiny after the Global Financial Crisis where they were considered to have to been playing a role in exacerbating the crisis, in particular in the bailout of AIG.

More recently, in March 2023, the collapse of US Silicon Valley Bank caused significant volatility in bank shares in the USA and EU. At the time, single-name CDS on certain EU banks were identified in the media as a potential cause of mispricing, raising concerns regarding their lack of transparency and limited liquidity. The events revealed that the single-name CDS market remains opaque and, in consequence, subject to a high degree of uncertainty and speculation as to the actual trading activity and its drivers.

This article focuses on the EU CDS market, and in particular that for EU banks single-name CDSs, in light of the March 2023 events. It aims to inform on the evolution of the market in terms of trading, clearing and concentration since the last ESMA analysis on EU CDS markets conducted in 2020. The scope of the article is at the market level, and so refrains from discussing individual entities or transactions related to these.

MR DR.22
Regulatory environment
Clearing and trading obligations
In the EU regulatory framework, certain derivatives are subject to a clearing obligation and a trading obligation.

The Derivative Trading Obligation (DTO) mandates the trading of specific liquid derivatives, such as on-the-run and first off-the-run 5Y iTraxx Europe Main and iTraxx Europe Crossover, on regulated platforms, so promoting market transparency, efficient price discovery, and risk mitigation to safeguard financial markets (Commission Delegated Regulation (EU) 2022/749).

Similarly, the Clearing Obligation mandates the clearing of similar products (on-the-run 5Y iTraxx Europe Main and iTraxx Europe Crossover) at an authorised EU CCP or a recognised third country CCP with the aim to reducing counterparty risk, increasing transparency, and ensure stability in the financial system (Commission Delegated Regulation (EU) 2016/1178).

Both regulations cover financial counterparties (FCs), including investment firms and credit institutions as well as non-financial counterparties (NFCs) that exceed certain thresholds.

30 ESMA’s Letter to the European Commission on the MiFIR review – transparency regime for single name-CDS and standardised OTC-derivatives.

Identification of CDS instruments

CDS are reported in EMIR as a credit derivative and as a swap contract type. The underlying of the CDS is reported through one of the two fields, the underlying identification (Field 8 of Table 2 of Commission Implementing Regulation (EU) 2017/105) or the reference entity (Field 84 of Table 2).

For this section, the identification of different CDS types (single-name vs multi-name) was done manually using the ISIN reported under the underlying identification for single-names, the name of the index for indices, or simply a “B” to denote usage of a basket of securities, as well as the LEI provided for the reference entity.

Accordingly, in the “Bank and insurance single-name CDS” section below, where ISINs were reported these were used. Where no ISIN was reported, we looked at the LEI reported under the reference entity field. Entities were then identified manually using their names. The resulting sample is made up of 18 EU banks and insurance companies. In charts where countries are displayed, only countries where there is more than one entity in the sample are displayed in order to avoid revealing information on specific entities (MR.DR.24).

CDS market overview

At the end of 2019, the total notional amount outstanding for CDS in the EU excluding UK was about EUR 3tn (EUR 10tn including the UK), a market highly concentrated among a few, mainly non-CCP, counterparties, and with the multi-name segment (i.e. those that refer to more than one underlying entity such as index CDS and CDS on baskets of securities) rising in share in a market that once was fully dominated by single-name instruments.

As of April 2023, the EU CDS market stood at EUR 5tn in terms of gross notional amount outstanding. Most of this notional outstanding (EUR 4tn) is now either in index or basket CDS, thus showing how this market has kept growing through widely-used CDS indices, such as iTraxx or CDX, and CDS that reference more bespoke baskets of securities. Corporate CDS (defined as non-sovereign single-name CDS) amounted to EUR 1.1tn and sovereign CDS to EUR 384bn (MR.DR.23).

Trading venues

Historically, a majority of CDS, and single-name CDS in particular, were traded bilaterally. Index CDS, such as iTraxx in Europe or CDX, were generally traded on venues or multilateral systems such as OTFs, MTFs or systematic internalizers.

However, recent data show that for corporate single-names, amounts outstanding that were traded on one of these facilities now add up to 9% of the total outstanding for this category, most of which was traded in the UK.

For indices and baskets, the share is higher, at 22% of the total, in part reflecting the fact that some of these products are subject to the DTO (MR.DR.24). While for sovereign CDS only marginal amounts are traded on OTFs or MTFs.

---

Central clearing

The level of central clearing is also now relatively high for corporate single-names, with 47% of the total notional outstanding cleared. For sovereign single-names, it is at 24%. Even though single-name CDS are not subject to the clearing obligation, those single-names that are part of CDS on indices are generally offered for clearing. For indices or baskets, the share of the outstanding notional centrally cleared is 58%, partly reflecting the fact that some of these products are subject to the clearing obligation.

The high level of central clearing on CDS markets brings with it with some features specific to this market. First, clearing is concentrated at a few CCPs, mainly one located in the EU and one outside the EU. Second, clearing membership is also highly concentrated at a limited number of banks, who make up the bulk of the notional, also in the non-cleared segment.

Another distinctive feature of the clearing environment is that most of the main underlying reference entities are only partly cleared, as opposed to a situation where big references, subject to a greater market depth and liquidity would be mostly cleared while the rest would not. This indicates that the drivers of central clearing have to be found elsewhere than the risk characteristics of the underlying, for example, in the risk characteristics of the counterparties to the trade themselves.

In addition, intragroup trades, largely uncleared and very often between EEA and non-EEA counterparties, grew substantially in recent years (MR-DR.13), in line with the findings on credit derivatives in the main report. The fact that a substantial portion of non-cleared trades are intragroup (56% of the non-cleared notional for corporate CDS, 43% for sovereigns) also reinforce this argument above, that the drivers of central clearing have to be found elsewhere than the risk characteristics of the underlying. In particular, on single-name CDS markets, the decision to clear centrally seems to be driven by counterparty risk rather than underlying entity risk factors.
Bank and insurance single-name CDS

In this final section, we focus on some of these main underlying corporate reference entities, those affected by the recent US regional bank turmoil. In particular, during the few weeks following the closure of SVB and Signature Bank in the US and the write-down of Credit Suisse AT1 bonds, EU markets saw a sharp increase in volatility, and single-name CDS on certain EU banks were cited in the media as a potential source of instability. We thus focus on a representative sample of 18 EU banks and (a few) insurance companies as the underlying of single-name CDS. The outstanding notional for single-name CDS with underlyings in this sample of banks and insurers amount to EUR 195bn.

The bank and insurance CDS markets are not structurally different from other corporate single-names. In particular, in terms of trading, 14% of the notional outstanding was traded at OTFs or MTFs, including a large majority traded at one previously recognised UK OTF. Central clearing is also substantial, with 47% of the notional held within a CCP (MR-DR.26).

This amount is largest in Germany, but here most of it is due to intragroup transactions, where the direct contagion risk of the wrong-way risk is limited to the confines of the group. However, it still presents potential risks, such as more challenging recovery and resolution processes in the event of a failure. In France, the member state with the second largest share, the wrong-ray risk appears more limited, although here it is not dominated by intragroup transactions.

Finally, one key risk aspect of CDS markets, especially when linked to underlying reference entities that can be deemed to be systemic like big EU banks, is the potential for ‘wrong way’ risk34. Wrong-way risk refers to a situation where the counterparty’s financial health are positively correlated, meaning that as the credit quality of the reference entity deteriorates, the counterparty’s ability to honour the protection obligation also weakens, thus worsening the overall credit risk. This can happen when for example, a bank sells the CDS of another bank located in the same country where, for example, events worsening the credit quality of the reference entity bank entity are also liable to adversely affect the counterparty bank.

In the chart below, we display the share of the notional amount outstanding excluding CCPS (leaving a total notional amount remaining of EUR 103bn), where EU banks or insurance companies are sold by counterparties located in the same country (MR-DR.27). In our sample, this only occurs in a few countries and at a moderate level.

---

34 Wrong way risk is monitored as per Article 291 of Regulation (EU) No 575/2013.
Conclusion

This article briefly examined the European Credit Default Swap (CDS) market, specifically focusing on single-name CDS contracts for EU banks. The market has seen an increase in gross notional amount outstanding, with a shift towards multi-name CDS contracts.

Trading has partially moved from bilateral trading to multilateral systems, while central clearing has become more prevalent, albeit concentrated among a few central clearing counterparties and clearing members. This speaks against the view that single-name CDS are not standardised, liquid or more generally fit enough for organised trading and central clearing.

The article also briefly explored the potential for wrong-way risk, where the creditworthiness of the reference entity and the counterparty’s financial health are positively correlated. It finds that the occurrence of such risk within the EU bank sample, as regards wrong-way risk related to CDS being sold in the same country as the underlying, is relatively low.
Statistical methods
EMIR trade-state data explained

Summary
EMIR data are vast and contain detailed information about European derivatives markets. The data are based on reports from EEA counterparties that are provided to trade repositories (TRs), which in turn report to ESMA. TRs prepare and pre-aggregate the data for authorities at different levels of granularity. One of these datasets, the trade-state data which offers a view on all outstanding EEA transactions, was used for as the basis for this report. In this section, we detail how we prepared and cleaned the data. In addition, we also provide an overview how these cleaning steps affected the underlying dataset.

Introduction
This year’s methodological section provides a short overview of the methodology employed and data-quality-enhancing measures taken by ESMA and the national competent authorities (NCAs). Given the continued prevalence of cleaning and preparation steps, it explains how each step affects the data used for the report.

EMIR data overview
This report is based on data reported under Article 9 of EMIR, which requires all counterparties concluding derivatives positions located in the EEA to report their trades (double-sided reporting regime) to a trade repository (TR). The information is reported by both counterparties separately but with the same identifier (i.e. trade ID) to a TR. The TRs provide access to data to the regulatory authorities based on their mandates, based on the jurisdiction the reporting counterparty is in (the national competent authority and ESMA).

The three main types of EMIR reports provided by TRs to the regulatory authorities are trade-activity, trade-state and position data. Trade-activity data are very granular, showing each lifecycle event of a transaction (e.g. conclusion, valuation, modification, termination). Trade-state data (also referred to as stock data) are at the next level of aggregation.

To produce the trade-state dataset, the TRs apply trade-activity messages to create or update records that represent the outstanding derivatives. However, once the derivative is closed or matures (as indicated in the Maturity Date field) the TRs removes the respective record. This means that these data show a snapshot of the latest information available on each outstanding derivative contract in the EEA.

The third type of report, position data provides information on outstanding derivatives between two counterparties at instrument level. Furthermore, initial cleaning steps are also included in the preparation, such as the removal of outliers. In essence, this dataset is mainly used for analysing cross-counterparty exposures in a quick and efficient manner.

As in previous editions, we use trade state data, and as in last year’s report, we look at an observation time-span of two years, 2021 and 2022. The data captures all open derivatives within the EEA, and derivatives between an EEA counterparty and to a third country or UK counterparty.

We again use quarterly data, and for each of the quarterly datapoints we select a Friday in the middle of the month to avoid potential effects caused by the expiry dates of ETDs and the regular compression exercises that are more likely to happen on the last Friday of the month.

As we use quarterly data, our four datapoints for 2021/2022 are based on the following four

35 Previous year’s reports provide more extensive descriptions of the steps we take to prepare data for our annual report. These are available here: https://www.esma.europa.eu/emas-activities/risk-analysis/risk-monitoring#esma-market-reports
36 This also includes the AIFs that are managed by AIFM authorised or registered under Directive 2011/61/EU
months: March, June, September and December. The number of records in 2021/2022, after the rigorous cleaning exercise explained below, ranges from 31mn to 37mn per quarter and totals 278mn records, aggregated over the eight quarterly dates of this report.

Regarding the overall data quality, we continue to see improvements. Nonetheless, we also identified several cases of counterparties over-reporting to the EMIR data set in the observation period, which required a special treatment given double reporting. First, records reported by the overreporting entities were removed (in so far these were self-reported). Second, derivatives reported by other counterparties against the overreporting entity were then duplicated. Third, for these duplicated records the ‘Counterparty ID’ and ‘Other Counterparty’ field were switched, and similarly, the ‘Counterparty Side’ field was negated. In this way, double reports where one side was an overreporting entity were artificially re-constructed based on the other, more accurate report. In contrast, single-reported positions of overreporting entities could not be corrected in this way and so were instead removed from the data set, highlighting a limitation of the approach.

Results from cleaning and correction process

To ensure a high level of data quality and to correct for specific factors within the EMIR reporting regime we again employed a multi-step data preparation procedure this year.

The first step, the outlier removal method was the same as in previous editions of this report. Our outlier removal procedure relies on two thresholds: a dynamic and a fixed one. The fixed threshold excludes reports whose notional amount is above EUR 10bn, while the dynamic threshold excludes reports whose log of the notional amount exceeds the median plus four standard deviations of the distribution of the log of the notional amounts.

As the market is very heterogenous the dynamic threshold is calculated for each derivative type where the derivative type is defined by the characteristics of the asset class, contract type, intragroup, compression and notional currency. This segmentation into derivative types leads to 2,124 different calculations with associated thresholds. With the same methodology as described in the last report the segments with less than 30 observations are treated differently. For these, the statistical parameters for the outlier detection are estimated using a regression model.

After the thresholds were calculated the outliers were identified and removed. This operation reduced the notional amount significantly, down to EUR 2,836tn while keeping 99.943% of the records (MR-DR.28).

</tbody>
</table>

Note: Total notional amounts in EUR trillion, aggregated over the eight quarters in 2021 and 2022. ‘Raw’ indicates the total notional amount before any outlier identification and treatment. ‘Outliers removed’ indicates the total notional amount after the removal of the outliers. ‘Double reporting removed’ indicates the total notional amount after the removal of double reporting. As the totals in this table aggregate the four quarters in 2020, the total notional amount for the fully cleaned data is about four times larger than the quarterly notional amount totals presented in the main body of the report.

Sources: TRs, ESMA.

In the next step, we took account of the double reporting nature of EMIR where one derivative between two counterparties results in two reports. Considering both reports would overstate the market size if calculated for the whole EEA area. As a large proportion of derivatives are conducted between EEA counterparties, and hence subject to the double reporting, we see a significant decline in the notional amount from this step also, down to EUR 2,260tn, in aggregate for the eight quarters in 2021/2022.

Interestingly, the relatively large notional amount removed at this step also indicates how much is traded among EEA counterparties relative to the other categories. We can observe that interest rate and credit derivatives, for which less of the notional amount is removed at this step, are traded mostly with counterparties located in third

---

countries (e.g. US or UK). In contrast for currency, commodity, and equity more of the notional amount is removed. This makes sense given these are traded more within the EEA and less with third countries. However, as these statistics apply to the whole observation period and are calculated on a gross notional basis which limits their explanatory power.

Conclusion and outlook
This article introduced the EMIR data set and its different level of aggregations. The main cleaning and correction steps were also highlighted along with presentation of statistics on how the different aggregates are affected.

ESMA continues to improve the data quality with several initiatives in cooperation with the NCAs. In 2022, for example, ESMA performed analysis of the full EMIR data set and published a data quality report (MR-DR.29). Another initiative is the 2014-established ‘Data Quality Action Plan’ (DQAP) which is a joint effort by NCAs and ESMA to improve data quality in several highly important areas. Looking forward, ESMA expects further improvements to data quality, as a result of its supervision and the continuing work of the NCAs.

MR-DR.29
EMIR and SFTR data quality report 2022
Need for increased efforts on data supervision
In April 2023 ESMA published its third report which focuses solely the data quality within the EMIR and SFTR reported data.39 The report covers the progress made in improving EMIR data quality for regulatory and supervisory uses.

In respect of EMIR, the report addresses discrepancies in outstanding derivatives between counterparties, which hinder authorities’ ability to assess relevant exposures. The discrepancies fluctuated, peaking at 26.1% in September 2021, but gradually decreasing since then. It also focuses on outstanding derivatives positions, which similarly affect accuracy. Here the analysis revealed a decreasing trend in errors, starting at 27.6% and declining to a low of 7.8%, with minor fluctuations. Overall, there has been a consistent decrease in the percentage of discrepancies in position reporting.

Additionally, the report focuses on the number of outstanding derivatives with timely and late valuations. Insufficient valuation information limits authorities’ monitoring capability. The percentage of late valuations also exhibits a significant downward trend, starting at 38.3% end of 2019 and declining rapidly. It reached a low of 13.2% in the observations at end of 2022, thus indicating the outcomes of the efforts to enhance data quality. This improvement enhances the usability of valuation information, crucial for EMIR data users.

The data quality report concludes that while good progress has been made, additional efforts are needed by national competent authorities (NCAs) and ESMA to further improve EMIR data quality.

Annexes
Glossary

**Central counterparty**: an entity that interposes itself between the two sides of a transaction, becoming the buyer to every seller and the seller to every buyer.

**Clearing**: the process of establishing positions, including the calculation of net obligations, and ensuring that financial instruments, cash, or both, are available to secure the exposures arising from those positions.

**Clearing member**: an undertaking that participates in a CCP and that is responsible for discharging the financial obligations arising from that participation.

**Client**: an undertaking with a contractual relationship with a clearing member of a CCP that enables that undertaking to clear its transactions with that CCP.

**Commodity forward**: a contract between two parties to purchase or sell a commodity or commodity index at an agreed price on a future date.

**Commodity option**: a contract that gives the buyer the right (but not the obligation) to purchase or sell a commodity or commodity index at an agreed price at or by a specified date.

**Commodity swap**: a contract between two parties to exchange sequences of payments during a specified period, whereby at least one sequence of payments is tied to a commodity price or commodity index.

**Counterparty**: an entity that takes the opposite side of a financial contract, for example, the borrower in a loan contract, or the buyer in a sales transaction.

**Credit default swap**: a contract whereby the seller commits to repay an obligation (e.g. bond) underlying the contract at par in the event of a default. To produce this guarantee, a regular premium is paid by the buyer during a specified period.

**Credit derivative**: a derivative whose redemption value is linked to specified credit-related events, such as bankruptcy, credit downgrade, non-payment or default of a borrower. For example, a lender might use a credit derivative to hedge the risk that a borrower might default. Common credit derivatives include credit default swaps (CDS), total return swaps and credit spread options.

**Currency option**: a contract that gives the buyer the right (but not the obligation) to purchase or sell a currency at an agreed exchange rate at or by a specified date.

**Currency swap**: a contract between two parties to exchange sequences of payments during a specified period, whereby each sequence is tied to a different currency. At the end of the swap, principal amounts in the different currencies are usually exchanged.

**Derivative**: a financial instrument whose value depends on some underlying financial asset, commodity or predefined variable. Derivative, or derivative contract, means a financial instrument as set out in points (4) to (10) of Section C of Annex I to Directive 2004/39/EC, as implemented by Article 38 and 39 of Regulation (EC) No 1287/2006.

**Equity forward**: a contract between two parties to purchase or sell an equity or equity basket at a set price at a future date.

**Equity option**: a contract that gives the buyer the right (but not the obligation) to purchase or sell an equity security or basket of equities at an agreed price at or by a specified date.

**Equity swap**: a contract between two parties to exchange sequences of payments during a specified period, where at least one sequence is tied to an equity price or an equity index.

**Exchange rate**: the price of one country's currency in relation to another.

**Exchange Traded Derivative**: A derivative that is traded on a regulated market or on a third-country market considered to be equivalent to a regulated market in accordance with Article 28 of MiFIR (Regulation (EU) No 600/2014 of the European Parliament and of the Council of 15 May 2014 on markets in financial instruments and amending Regulation (EU) No 648/2012), and as such does not fall within the definition of an OTC derivative as defined in Article 2(7) of Regulation (EU) No 648/2012, according to Article 2 of MiFIR.

**Financial counterparty**: an investment firm authorised in accordance with Directive 2004/39/EC; a credit institution authorised in accordance with Directive 2006/48/EC; an insurance undertaking authorised in accordance with Directive 73/239/EEC; an assurance undertaking authorised in accordance with Directive 2002/83/EC; a reinsurance undertaking authorised in accordance with Directive 2005/68/EC; a UCITS and, where relevant, its management company, authorised in accordance with Directive 2009/65/EC; an institution for occupational retirement provision within the
meaning of Article 6(a) of Directive 2003/41/EC; and an alternative investment fund managed by AIFMs authorised or registered in accordance with Directive 2011/61/EU.

**First counterparty basis:** a methodology whereby positions are allocated to the primary party to a contract.

**Insurance:** for this report, unless explicitly separated, insurance is the aggregation of an insurance undertaking authorised in accordance with Directive 73/239/EEC; an assurance undertaking authorised in accordance with Directive 2002/83/EC; and a reinsurance undertaking authorised in accordance with Directive 2005/68/EC.

**Interconnectedness:** interconnectedness is a market-level centralisation measure based on the network-centrality scores of each counterparty in the market, while the market is defined as all derivatives outstanding within an asset class. This is done using the R package igraph. The underlying formula is:

\[
\text{Interconnectedness}(\text{market}) = \sum \max(c(w), w) - c(v, v)
\]

where \(c(v)\) is the centrality of counterparty \(v\). The market-level centrality score is then normalized by dividing it by the maximum theoretical score for a theoretical market with the same number of counterparties. It ranges between 0 and 1, 0 being the minimum level of interconnectedness and 1 the maximum. For eigenvector interconnectedness the most centralized structure is the graph with a single edge (and potentially many isolates).

**Interest rate option:** a contract that gives the buyer the right (but not the obligation) to pay or receive an agreed interest rate on a predetermined principal at or by a specified date.

**Interest rate swap:** a contract to exchange periodic payments related to interest rates on a single currency. It can be fixed for floating, or floating for floating based on different indices. This group includes those swaps whose notional amount principal is amortised according to a fixed schedule independent of interest rates.

**Notional amount outstanding:** total nominal or notional amount value of all derivatives contracts concluded and not yet settled on the reporting date.

**Over the counter:** an ‘OTC derivative’ or ‘OTC derivative contract’ means a derivative contract the execution of which does not take place on a regulated market as within the meaning of Article 4(1)(14) of Directive 2004/39/EC or on a third-country market considered as equivalent to a regulated market in accordance with Article 19(6) of Directive 2004/39/EC.

**Pension funds:** for this report, an institution for occupational retirement provision within the meaning of Article 6(a) of Directive 2003/41/EC.

**Portfolio compression:** portfolio compression is defined in MIFIR as a risk reduction service in which two or more counterparties wholly or partially terminate some or all of the derivatives submitted by those counterparties for inclusion in the portfolio compression and replace the terminated derivatives with another derivative whose combined notional amount value is less than the combined notional amount value of the terminated derivatives.

**Remaining maturity:** the period from the reference date until the final contractually scheduled payment.

**Swap:** financial derivative in which two parties agree to exchange payment streams based on a specified notional amount for a specified period.

**Trade repository:** a legal person that centrally collects and maintains the records of derivatives.
