Note: Assessment of main risks by risk segments for markets under ESMA remit since last assessment, and outlook for forthcoming quarter. Assessment of main risks by risk categories and sources for markets under ESMA remit since last assessment, and outlook for forthcoming quarter. Risk assessment based on categorisation of the ESA Joint Committee. Colours indicate current risk intensity. Coding: green=potential risk, yellow=elevated risk, orange=high risk. Upward arrows indicate an increase in risk intensities; downward arrows a decrease; horizontal arrows no change. Change is measured with respect to the previous quarter; the outlook refers to the forthcoming quarter. ESMA risk assessment based on quantitative indicators and analyst judgement.

ESMA’s 1Q17 overall risk assessment remains unchanged from 4Q16. In 1Q17, EU financial markets remained relatively calm with stable volatility and increasing equity market prices. EU sovereign bond yields continued to increase in 1Q17 by around 19 bps on average mirroring US government bonds. However, yield developments were heterogeneous with potential reactivity to political events reflected in higher than average yield increases for some member states. Investment fund liquidity remained a concern with strong bond and equity funds inflows, potentially subject to event-related reversals. While main risks remained high, our outlook for market, liquidity, credit and contagion risk is stable. The low yield environment and related sustained concerns with regard to excessive risk taking and asset pricing persisted. Going forward, we consider political uncertainties, incl. the Brexit negotiations and the election calendar in the EU, as the most important potential sources of risk in 2017.

Risk summary

In 1Q17, risks in the markets under ESMA remit remained at high levels, reflecting very high risk in securities markets, and elevated risk for investors, infrastructures and services. Our assessment of the individual risk categories did not change from 4Q16, with market and credit risk remaining very high due to the persisting low-interest rate environment, continued weaknesses in the EU banking sector and geopolitical developments. Liquidity risk is still assessed as high, with liquidity pressures in segments of the fund industry and in repo markets. Contagion risk remained high, driven by high levels of interconnectedness between different segments of financial markets amplified by the low-yield environment and associated incentives for risk-taking. Finally, operational risk remained a key concern. The risk outlook is stable across all risk categories, reflecting the stabilised macroeconomic environment and the non-materialisation of risk premia reversals following recent US monetary policy actions.

Systemic stress was broadly stable in 1Q17, decreasing slightly at the beginning of the reporting period (R.2), with bond markets as the main risk contributor. Risks linked to the macroeconomic environment (GDP, inflation) stabilised, although market uncertainty over potential changes in the European monetary policy stance are still prevailing. Political events could bring additional uncertainty to financial markets (Brexit, important elections in EU Member States, US policy agenda).

R.2
ESMA composite systemic stress indicator
Systemic risk broadly stable in 1Q17

Note: ESMA version of the ECB-CISS indicator measuring systemic stress in securities markets. It focuses on three financial market segments: equity, bond and money markets, aggregated through a standard portfolio theory. It is based on securities market indicators such as volatilities and risk spreads. Sources: ECB, ESMA.
Risk sources

Macroeconomic environment: The EU economic recovery is expected to continue in 1Q17 with, for the first time in a decade, GDP growth expected in all EU member states. Domestic demand is set to remain the main growth driver, supported by sustained improvements in employment and a rise in nominal wage growth. Investment is expected to continue growing only moderately. Inflation in the EA has recently increased and is expected to be at a higher levels in 2017, though still falling short of the 2% target level over the medium term. The aggregate EA public deficit and government debt-to-GDP ratio are expected to fall further in 2017. However, significant downside risks for the EU economic growth outlook remain. This is due to important elections to be held in a number of EU member states, the upcoming Article 50 negotiations with the UK and the US policy agenda.

Low-interest rate environment: The ECB and BoE monetary policies remained highly accommodative. In this context, despite the general increase in sovereign yields since 2H16, which continued in 1Q17, the low-interest environment and related search for yield strategies still represent a source of concern. This is illustrated by strong issuance of high-yield bonds (R.18) and strong positive inflows for EU funds investing in emerging market and high yield fixed-income products (EUR 19bn and 18bn, respectively) in 1Q17. On the other hand, government bond funds registered net outflows (EUR -8.8bn) (R.24). In this context, excessive risk-taking and capital misallocation remain risk sources in the medium-term outlook.

EU sovereign debt markets: In 1Q17, EU sovereign bond yields continued to increase mirroring the behaviour of US government bonds following the outcome of the US Presidential elections and the US Fed interest rate increase. Ten-year EU government bond yields rose by 19bps to 1% on average for the main EU countries at the end of March, above the 0.9% five-year moving average. Net sovereign debt issuance was negative over the same period. Sovereign bond bid-ask spreads seem to have converged to higher levels since the end of 2016, which, together with widely dispersed sovereign risk premia could be a sign of a decoupling among member states on sovereign bond markets.

Market functioning: No significant disruptions in the functioning of EU markets were observed in 1Q17. Central clearing remained at a high level following the entry into force of the clearing obligation on G4 currency IRS in 2016 and on Index Credit Default Swaps on 9 February 2017. Settlement fails remained at a low level after the adoption by the EC of a package of legislative acts improving securities settlement. Further T2S migrations including the one of the German market in February are expected to increase the volumes on this platform and to contribute to the integration of post-trade processes across participating EU markets. Finally, cyber risk is considered as one of the major risks facing financial markets institutions, both with respect to their business continuity and the integrity of proprietary data. Financial market infrastructures (FMIs) such as trading venues, CSDs, TRs and CCPs are becoming more and more central to the financial system, for example on derivatives markets. Thus, the size of these institutions, as well as the potential for contagion make a proper monitoring of cyber risk essential to the stability of financial markets. Furthermore, the intertwining of Fintech and FMIs, for example through DLT, anchors technology risk as a long term but rapidly evolving risk for these companies.

Political and event risk: Uncertainties around the Brexit negotiations are the most important source of political risk in the EU financial market. Negotiation outcomes and related news flow may result in intensified political and event risk going forward, with greater asset price volatility in EU markets as a potential effect. The election calendar in EU member states is a second source of political uncertainty (incl. parliamentary elections in France and Germany), even if the French presidential election, as a source of significant market nervousness in the run-up, was concluded and met with benign equity and bond market reactions. Policy issues at international level, incl. uncertainty over the future direction of global financial market policy coordination, as well as geostrategic risks continue to weigh on market sentiment in the EU.

---

2 Regulation (EU) No 909/2014 on improving securities settlement in the EU and on central securities depositories.
Risk categories

Market risk – very high, outlook stable: In 1Q17 EU equity market prices continued to increase, e.g. for financials excl. banks (+8.7%) and non-financials (+6.6%). Nevertheless, these developments were less pronounced than in the US after the presidential election as illustrated by P/E ratios in the EU still far below the ones in the US (R.5). Implied volatilities on the other hand remained at a low level, for example for short-term swaps. The GBP exchange rate implied volatility peaked in January around the announcements that made a hard Brexit scenario more probable, only to decrease later on. In this context of high political uncertainty with past elections and their still uncertain consequences as well as several elections in EU member states in 2017, markets are still prone to strong reactions and are likely to remain so during the coming months.

Liquidity risk – high, outlook stable: Liquidity in equity markets slightly deteriorated with the composite equity illiquidity indicator (R.4) increasing in 1Q17. On corporate bond markets the picture was mixed with lower bid-ask spreads as signal for increased liquidity, but a more volatile Amihud illiquidity indicator\(^3\), though remaining at low levels (R.14). The sharp drop in repo rates observed at the end of 2016 resulted in greater dispersion between the scarcity premia on bonds that are in very high demand (the highest percentiles) and the median premium. The dispersion then reduced in 1Q17, though remains at comparatively high levels (R.12). The reduction can be partly linked to the December ECB’s QE announcement, but high dispersion levels reflect potential high-quality collateral shortages that could impede overall liquidity. Sovereign bond bid-ask spreads remained stable overall but increased for most of the more vulnerable member states. Covered bond spreads, after having also ticked up in December, reversed slowly toward lower levels.

Contagion risk – high, stable outlook: In sovereign bond markets, the correlation between the German and other EU countries’ ten-year bond yields decreased at the beginning of 1Q17 while the dispersion increased across member states. However, one peripheral country sovereign bond market was driving the bottom 25% dispersion (R.17). Dispersion then decreased towards the end of 1Q17. Concerns over banking sector balance sheet issues and their potential contagion to other sectors such as insurance and pensions or funds are still present.

Credit risk – very high, outlook stable: At the beginning of 2017, corporate bond spreads remained around their 4Q16 levels. Issuance of high-yield, securitised products as well as money market and sovereign bonds was higher in 1Q17 than during the previous quarter (R.18) while the credit quality of the outstanding corporate bond debt continued to deteriorate (R.15). Redemption needs for banks over the medium term (from 3Q17 to 4Q18) are at a lower level than last year but are still a short-term source of risk.

Operational risk – elevated, stable outlook: Technology and conduct risks remain a key concern both within and outside the EU. In 1Q17, no trading disruptions were observed on EU financial markets. However, operational risk issues were highlighted by the GBP flash-crash on 7 October 2016 and enquiries into its causes continued. According to a BIS report, the combination of fragile market conditions, poorly controlled algorithms and inexperienced staff created a “mechanical cessation of trading on the futures exchange and the exhaustion of the limited liquidity on the primary spot FX trading platform, which encouraged further withdrawal of liquidity by providers reliant on data from those venues”\(^4\). Finally, the increased dispersion in Euribor contributions (R.35) underlines the importance of sound and well managed financial benchmarks.

---

3 The Amihud illiquidity ratio is a widely used measure of stock market illiquidity and measures the price impact of trading. It is calculated as the daily ratio of absolute stock returns to its volume, averaged over the chosen period. A smaller value of the coefficient means lower price impact and so higher liquidity.

### Securities markets

#### Risk summary

**Risk level**

- ![Risk change from 4Q16](image1)

**Outlook for 2Q17**

- ![Upward arrows indicate a risk increase, downward arrows a risk decrease.](image2)

Note: Assessment of main risk categories for markets under ESMA remit since past quarter, and outlook for forthcoming quarter. Systemic risk assessment based on categorisation of the ESA Joint Committee. Colours indicate current risk intensity. Coding: green=potential risk, yellow=elevated risk, orange=high risk, red=very high risk. Upward arrows indicate a risk increase, downward arrows a risk decrease. ESMA risk assessment based on quantitative indicators and analyst judgement.

#### Risk drivers

- Asset re-evaluation and risk re-assessment.
- Low-interest-rate environment and excessive risk taking.
- Uneven EU growth.
- Banking sector balance sheet issues.
- Political and event risks.
- Potential scarcity of collateral.

#### Equity illiquidity

**Decrease in liquidity**

Note: Composite indicator of illiquidity in the equity market for the current Stoxx 600 constituents, computed by applying the principal component methodology to six input liquidity measures (Amihud illiquidity coefficient, bid-ask spread, Hul-Haevel ratio, turnover value, inverse turnover ratio, MBC). The indicator range is between 0 (higher liquidity) and 1 (lower liquidity).

Sources: Thomson Reuters Datastream, ESMA.

#### Equity prices

**Continued increase in 1Q17**

Note: STOXX Europe 600 equity total return indices. 01/01/2015=100.

Sources: Thomson Reuters Datastream, ESMA.

#### Exchange rate volatilities

**Brexit-related GBP peak in early 1Q17**

Note: Implied volatilities on 3M forward ICAP Euro vs. 3M Euroirr swaps based on the Normal volatility model, in bp; low panel: Euro Stoxx 50 implied volatilities, measured as price indices, in %.

Sources: Bloomberg, Thomson Reuters Datastream, ESMA.

#### Financial instruments volatilities

**Stable volatility**

Note: Top panel: implied volatilities on 1M forward ICAP Euro vs. 3M Euribor swaptions based on the Normal volatility model, in bp; low panel: Euro Stoxx 50 implied volatilities, measured as price indices, in %.

Sources: Bloomberg, Thomson Reuters Datastream, ESMA.

#### Sovereign risk premia

**Mixed development across countries**

Note: Selected 10Y EA sovereign bond risk premia (vs. DE Bunds), in %.

Sources: Thomson Reuters Datastream, ESMA.
R.10
Sovereign bond bid-ask spread
Increasing for more vulnerable countries

Note: Liquidity measured as the one-month moving average of the difference of ask and bid yields for 10Y sovereign bonds, in basis points. EU Median computed using data for 25 countries. Logarithmic scale.
Sources: Bloomberg, ESMA.

R.11
CDS volumes
Stable or slightly decreasing

Note: Value of outstanding notional sovereign CDS for selected countries; USD bn.
Sources: DTCC, ESMA.

R.12
Repo markets specialness
Reduced dispersion, though still at high levels

Note: Median, 75th and 90th percentiles of weekly specialness, measured as the difference between general collateral and special collateral repo rates on government bonds in selected countries.
Sources: RepoFunds Rate (BrokerTec, MTS, ICAP), ESMA.

R.13
Corporate bond spreads
Broadly stable in 1Q17

Note: EA non-financial corporate bond spreads by rating between iBoxx non-financial corporate bond indices, basis points.
Sources: Thomson Reuters Datastream, ESMA.

R.14
Corporate bond bid-ask spreads and Amihud indicator
Bid-ask spread decreased, volatile Amihud

Note: EUR Markit iBoxx corporate bond index bid-ask spread, in %, computed as a one-month moving average of the iBoxx components in the current composition. 1Y-MA=one-year moving average of the bid-ask spread; Amihud liquidity coefficient index between 0 and 1. Higher value indicates less liquidity.
Sources: Markit, ESMA.

R.15
Outstanding long term corporate debt
Increased share of BBB and lower

Note: Outstanding amount of corporate bonds as of issuance date by rating category, in % of the total.
Sources: Thomson Reuters Eikon, ESMA.

R.16
Covered bond spreads
Decrease in 1Q17

Note: Asset swap spreads based on iBoxx covered bond indices, basis points. 5Y-MA=five-year moving average of all bonds.
Sources: Thomson Reuters Datastream, ESMA.

R.17
Dispersion in sovereign yield correlation
Decreased dispersion

Note: Dispersion of correlations between 10Y DE Bunds and other EU countries' sovereign bond redemption yields over 60D rolling windows.
Sources: Thomson Reuters Datastream, ESMA.
R.18 Debt issuance growth

Higher issuance for HY, MM and SOV

Note: Growth rates of issuance volume, in %, normalised by standard deviation for the following bond classes, following Eikon classification: securitised (SEC); high-yield (HY); investment grade (IG); covered bonds (CB); money market (MM); sovereign (SOV). Percentiles computed from 1Q rolling window. All data include securities with a maturity higher than 18M, except for MM (maturity less than 12M). Bars denote the range of values between the 10th and 90th percentiles. Negative net issuance in the EU.

Sources: Thomson Reuters Eikon, ESMA.

R.19 Net sovereign debt issuance

Negative net issuance in the EU

Note: Quarterly net issuance of EU sovereign debt by country, EUR bn. Net issuance calculated as the difference between new issuance over the quarter and outstanding debt maturing over the quarter. Highest and lowest quarterly net issuance in the past year are reported. EU total on right-hand scale.

Sources: Thomson Reuters Eikon, ESMA.

R.20 Hybrid capital issuance and outstanding

Close to 5Y MA

Note: Outstanding amount computed as the historical cumulative sum of the difference between issuance and maturity of covered bonds, EUR tn. Issuance in EUR bn. 5Y-MA = five-year moving average of issuance.

Sources: Thomson Reuters Eikon, ESMA.

R.21 Debt redemption profile

Bank short-term financing needs

Note: Quarterly redemptions over 3Y-horizon by EU private financial and non-financial corporates, current (column) and change over one year (dotted lines), EUR bn.

Sources: Thomson Reuters Eikon, ESMA.
**Investors**

### Risk summary

**Risk level**

**Risk change from 4Q16**

**Outlook for 2Q17**

Note: Assessment of main risk categories for markets under ESMA remit since past quarter, and outlook for forthcoming quarter. Systemic risk assessment based on categorisation of the ESA Joint Committee. Colours indicate current risk intensity. Coding: green=potential risk, yellow=elicited risk, orange=high risk, red=very high risk. Upward arrows indicate a risk increase, downward arrows a risk decrease. ESMA risk assessment based on quantitative indicators and analyst judgement.

### Risk drivers

- Sustained search for yield.
- Asset re-valuation and risk re-assessment.
- Correlation in asset prices.
- Continued inflow into EU fund industry with potential event-related reversal.
